The Greatest C. Measure

A number is said to be a measure of another number when it will divide it without a remainder; as 2, is a measure of 6, because it divides 6 exactly. A number is said to be a common measure of two or more numbers when it will exactly divide those numbers; and the greatest number which will so divide them is called the greatest common measure. ——

Thus, 2, 4, 12 are common measure, of 24 and 36 and 12, is their greatest common measures ——

A number is ~~a prime~~ called a *prime* when it cannot be divided exactly by a number greater than 1. Thus 3, 5, 7 are prime numbers because they have no divisor greater than 1. We shall write G. C. M. for the greatest Common measure ——

To find the G.C.M of two or more numbers

Take two of the proposed numbers, and divide the greater by the less; if there be a remainder, make that

a new divisor, and take the former divisor as a new dividend, and continue this process until there be no remainder: the last divisor will be the G. C. M.—

If there be a third number, go through the same work with this third number, and the G. C. M. of the other two; then, the last divisor will be the last divisor will be the G. C. M. And the same process must be continued if there be 4th, &c. Or any amount of numbers of which we have to find the G. C. M.

Find the G. C. M. of 348, & 390?

348) 390 (1
348
42) 348 (8
336
12) 42 (3
36
6) 12 (2
12
∴ 6 is the G. C. M.

The G. C. M. of 510 & 595?

510) 595 (1
510
85) 510 (6
510
∴ 85 is the G. C. M.

Find the G. C. M. of 36, 27 & 144?

27) 36 (1
27
9) 27 (3
27
∴ 9 is the G. C. M

9) 144 (16
9
54
∴ 9 is the G. C. M

Find the G. C. M of 324, 456 & 728?

324) 456 (1
324
132) 324 (2
264
60) 132 (2
120
12) 60 (5
60

12) 72 (6
72
4) 12 (3
12

∴ 12 is the G. C. M of 324 & 456 but 4 is the G. C. M of all the three

Common Multiple

Of two numbers the larger is said to be a multiple of the smaller, when the larger can be divided exactly by

a number without a remainder by the smaller; and the
smaller number is said to be a measure of the larger.
Thus since 12 can be divided exactly by 4, 12 is called
a multiple of 4 and 4 a measure of 12. So 16 is a multiple of 8 is
a measure of 16.

Also, one number is said to be a common multiple of two or more
numbers, when it can be divided exactly by the two or more
numbers. Thus 24 is a common multiple of 6, 4 & 2 because
it can be divided exactly by those numbers; 12 is the least
common multiple

To find the L C M break the number into their prime
factors, and then multiply together the greatest number of
different prime factors for the L C M.

Find the L. C. M. of 2, 3, 4 & 8?

2 = 1 X 2
3 = 1 X 3
4 = 2 X 2
8 = 2 X 2 X 2

1 2 3 X 2 X 2 X 2 = 24 ∴ 24 is the L C M of 2, 3 4 8

Find the L C M of 3, 5, 9, 16 & 20?

20=2X2X5

∴720 is the L C M of 3, 5, 9, 16, & 20

1X2X2X2X2X3X3X5=720

Find the L C M of 5, 7, 9, 12, 15

5=1X5
7=1X7
9=3X3
12=2X2X3
15=3X5

1X5X7X3X3X2X2=1260, ∴1260 is the L C M of 5, 7, 9, 12, & 15

Find the L C M of 36, 54, 85 & 90

36=3X3X2X2
54=3X3X3X2
85=5X17
90=3X3X2X5

3X3X3X2X2X5X17=9180, ∴9180 is the L C M of 36, 54, 85 & 90

Find the L C M of 63, 100 & 72

63=3X3X7
100=2X2X5X5
72=2X2X2X3X3

2X2X2X3X3X5X5X7=12600, ∴12600 is the L C M of 63, 100, & 72

Fractions

By the term Unit, we are to understand a single article of any kind, as Inch, Yard, Penny, Ounce, &c

Unity is merely another name for the figure 1

A fraction is a part or parts of a number or quantity, supposed to be broken into any number of equal portions. If then, the unit be divided into 4, 5, or 6 equal parts, one of these parts will be called one fourth one fifth, or one sixth, and is thus written $\frac{1}{4}, \frac{1}{5}, \frac{1}{6}$. So also, if any two of these parts be taken, the quantities thus taken will be called two fourths two fifths and two sixths, and be written $\frac{2}{4}, \frac{2}{5}, \frac{2}{6}$.

The number below the line, which shows into how many parts the unit was broken, is called the denominator because it expresses the denominator, or kind of parts, as fourths, fifths, sixths. The upper number, which he numerates, or counts, how many parts are taken is called the numerator. Thus, in the fraction $\frac{2}{5}$, 5 is the denominator, 2 the numerator.

A fraction is sometimes used to express division; as $\frac{2}{5}$ means that 2 is to be divided by 5.

A fraction is called a proper fraction when the num^{r} is less than the den^{r} thus $\frac{3}{5}$ or $\frac{4}{5}$ are called proper fraction because they really represent a part or parts of a unit, and are less than the whole unit.

A fraction whose num^{r} is equl, to, or is greater than the denam^{r}, is called an improper fraction. Thus, $\frac{5}{5}$, $\frac{12}{1}$, are called improper fractions because they are not in reality parts of a unit broken up i.e. are not less than the whole unit but they are either one compleate unit or more than one

A whole number may be made to appear as an improper fraction with any required denr. by multiplying and dividing by the whole number by that denominator.

Thus, $9 = \frac{9 \times 5}{5} = \frac{15}{5}$: if the required denr. be $\frac{5}{7}$ $9 = \frac{9 \times 7}{7} = \frac{63}{7}$.

A mixed number is one formed of a whole number and a fraction, as $3\frac{2}{5}$, which is read three and two fifths that is, three units, and two fifths of another unit; just as 3s. 6d means 3 shillings and $\frac{1}{2}$ of another shilling, and might be written 3 $\frac{1}{2}$ sh. were the unit is one shilling.

A fraction consisting of two or more fractions, connected by the word of placed between them, is called a compound fraction; as $\frac{2}{3}$ of $\frac{5}{7}$ of $\frac{6}{9}$:

and a complexed fraction is one in which either the numr. or denr, or both are fractions; as

$\frac{2\frac{3}{4}}{4}$ $\frac{3}{1\frac{1}{2}}$ $\frac{1\frac{1}{3}}{3\frac{3}{5}}$ $\frac{6}{7}$ of $\frac{1\frac{3}{5}}{11\frac{1}{5}}$, &c.

This last fraction is thus read: eight ninths of one and two thirds, divided by seven and one fifth.

This last fraction is thus read: eight ninths

To ascertain the weight of a beast while alive
Rule. By the square of the girth multiply five times the
length divide the product by 21.
Suppose the girth of a cow be 6 ft. and the length
5 ft.
